EXECUTIVE SUMMARY

Department of Energy Material Storage Area (DMSA) Outside (OS)-18 is located south of the C-746-P Regulated Scrap Yard. It is a large DMSA occupying approximately 48,000 square feet (ft^2). It is also identified as Solid Waste Management Unit (SWMU) #229. Field activities were initiated in March 2003 and completed in September 2003. This area has been used for many years as a storage area for excess and used railroad supplies and parts. It also contained a large quantity of concrete and brick rubble, wood, miscellaneous scrap metal and used equipment. Two small buildings were also stored in the DMSA. A small quantity of oil was drained from equipment and handled as Resource Conservation Recovery Act (RCRA) hazardous/mixed waste. Hazardous wastes are classified as either newly discovered or newly generated. These classifications are discussed in greater detail in the RCRA section of this summary. The waste within the DMSA had a volume of approximately 16,658.86 cubic feet (ft^3) and estimated weight of 944,056 pounds (lbs). The majority of the material in the DMSA was classified as Solid Waste and disposed of in the C-746-U Landfill. A small volume was classified as low level radioactive waste (LLW). It is packaged in intermodal containers that are staged in a designated area while awaiting National Elimination Policy Act (NEPA) approval for offsite shipment. This DMSA was originally classified as a Phase 2 but was downgraded to a Phase 1. It is now classified as a Phase 3 since it has been fully characterized. The DMSA is empty of the original waste but is being used as a staging area for roll-off bins of waste awaiting disposition. The DMSA project has initiated usage of forms (sheets) entitled "WESKEM W (Waste) Identification Sheets". The use of these sheets will significantly reduce paperwork and improve efficiency of documentation of the characterization and disposal process. Each W sheet will have a unique identification number. The sheet will be used to identify individual wastes or containers. The W sheets will then be utilized as attachments to Request for Disposal (RFD) forms when the wastes are being prepared for disposal. This process is being phased in as work progresses in the DMSAs. Photographs were taken of the area and the wastes in the area during and after the characterization program. Several are included in this report.

RCRA/RCRA MIXED

RCRA hazardous wastes are identified as either "newly discovered" or "newly generated". Newly discovered wastes are those hazardous wastes that are found loose or not installed in equipment. Examples of this waste type are aerosol cans or light bulbs lying on the floor. Newly generated wastes are hazardous wastes that must be removed from equipment (such as circuit boards) or drained from equipment (such as oil). DMSA OS-18 had oil drained from a piece of equipment. The oil was packaged in a five-gallon container. This RCRA/Mixed waste was classified as newly generated. It was labeled and placed in a Satellite Accumulation Area (SAA) within the DMSA. The SAA was established on April 17, 2003. The waste oil was transferred to the C-752-A RCRA permitted storage facility. The SAA was closed on August 12, 2003.

TSCA-PCB/ACM

There were no polychlorinated biphenyl (PCB) wastes identified in OS-18. Five fire proof safes, two pallets of floor tile and a piece of transite were classified as asbestos containing material (ACM) solid waste. These wastes were disposed in the C-746-U Landfill.

LLW

Approximately 166 ft³ of used equipment was classified as LLW and placed in intermodal containers. The intermodals are staged in another DMSA while awaiting NEPA approval for offsite disposition.

SOLID WASTE

All of the waste, with the exception of the waste oil and the LLW, was classified as solid waste and disposed of in the C-746-U Landfill. The solid waste was placed in roll-off bins for transport to the landfill. The DMSA Inventory and Disposition form identifies the disposition date and landfill package number (shipment number).

NCS

There were no Nuclear Criticality Safety (NCS) wastes or issues in DMSA OS-18.

REUSABLE MATERIAL

There were no reusable materials identified in OS-18.

D&D ITEMS

There were no decontamination and decommission (D&D) items/systems in DMSA OS-18.

IH

The exposure assessment conducted for OS-18 did not warrant the implementation of an Industrial Hygiene (IH) sampling strategy plan.

HP

Healths Physics (HP) surveys that are conducted may include smears, direct readings or air samples. Air samples are normally taken only in contamination areas and/or when opening containers with unknown contents. The highest total alpha reading from the radiological surveys was 712 disintegration per minute (dpm) per 100 square centimeters (cm²). This reading was from a hydraulic jack lying on a pallet. This waste was sent to the C-746-U Landfill. The highest total/beta gamma reading was 266,766 dpm/100 cm². This reading was from a 30-gallon trash can that was packaged and handled as LLW.

SAFETY

There were no safety related events during the characterization program. Pre-job briefings were conducted with all entry and support personnel to ensure that individual responsibilities were understood. A safety officer was in attendance during all phases of work to monitor conditions and provide safety related input to workers. All workers had

stop work authority to ensure that unusual or unexpected events were addressed before work was allowed to proceed.
